Exposing Hidden Threats: Cohesity and Google Cloud Bring Secure Sandbox Power

If your organization treats backup data as a safety net, what happens when that safety net harbors hidden threats you can't see? Traditional backup security tools rely on static signatures and siloed workflows that let sophisticated, stealthy malware quietly persist inside historical backups. Now there is a shift happening that elevates backup data from passive record to active defender. Cohesity is teaming up with Google Cloud to embed real-time threat intelligence and secure sandbox analysis directly into the Cohesity Data Cloud platform, enabling security and IT leaders to identify, analyze, and eliminate malicious code before it ever triggers a damaging event. This is about moving from reactive cleanup to proactive resilience, and it signals a new era in cyber defense where backups are a source of truth, not risk.

Here are the strategic innovations that matter most for leaders focused on cyber resilience and operational efficiency:

- Integration of Google Threat Intelligence into the Cohesity Data Cloud console means teams see contextual threat insights and reputational data alongside backup content, reducing tool switching and manual friction.
- Secure sandbox analysis powered by Google Private Scanning lets suspicious files be detonated in a fully isolated environment, delivering detailed behavioral insights without exposing sensitive data outside your control.
- This approach unifies detection, validation, and recovery workflows so IT and security teams can collaborate more confidently, accelerating response times and strengthening overall cyber resilience.

As attackers get smarter, security leaders must embed intelligence and validation deeper into core workflows—not tack them on later. To understand how this capability can reshape your risk posture and boost confidence in recovery decisions, click through to read the full announcement.

Cohesity FortKnox is now available on Google Cloud

What if your backups could do more than just sit quietly in storage? What if they could help you uncover hidden threats that your standard tools miss? That is exactly what Cohesity is introducing with its new secure sandbox analysis powered by Google Threat Intelligence. Attackers continue to evolve, often planting malware that slips past signature-based scanners. This new capability lets teams safely analyze suspicious files inside an isolated environment and get a clear view of what those files would do if they ever had the chance to execute.

Here are the key points worth paying attention to:

- Deeper threat visibility with behavioral analysis that goes beyond traditional scanning
- Secure sandbox detonation using Google Threat Intelligence Private Scanning for safe and isolated testing
- Detailed runtime reports showing process activity, network behavior, system modifications, and a clear verdict
- A fully integrated workflow inside the Cohesity Data Cloud so teams avoid manual exports or extra tools

If you want to understand how this new approach can elevate your threat analysis, boost recovery confidence, and modernize your cyber resilience strategy, click through to read the full blog.

What if the real breakthrough in cyber resilience isn't just faster detection but deeper understanding? As attackers grow more skilled at hiding malware inside backup data and evading signature-based tools, organizations need a way to validate threats based on actual behavior, not assumptions. That is the thinking behind Cohesity's new secure sandbox analysis powered by Google Threat Intelligence. Instead of relying solely on traditional scans, teams can now safely execute and study suspicious files in a controlled environment directly within the Cohesity Data Cloud, gaining evidence-driven insights that strengthen both investigation and recovery decisions. This shift represents a more mature and proactive approach to cyber defense, where backups evolve from passive storage to an active source of intelligence.

Here are the key points you should know:

- Backup-native threat hunting with richer indicators of compromise and reputation data so you can find threats others miss.
- Secure sandbox detonation in an isolated environment powered by Google Threat Intelligence so you never expose live systems.
- Detailed behavioral analysis including runtime actions, network connections, registry changes, dropped files, and more.
- A unified workflow inside the Cohesity Data Cloud console that keeps your team productive and secure without extra tools or manual handoffs.

If you want to see how this capability can sharpen your cyber resilience strategy and give you real evidence instead of guesswork, click through to read the full blog and get all the details.

Why Cohesity? Cohesity protects, secures, and provides insights into the world's data. As the leader in AI-powered data security, Cohesity helps organizations strengthen resilience, accelerate recovery, and reduce IT costs. With Zero Trust security and advanced AI/ML, Cohesity Data Cloud is trusted by customers in more than 140 countries, including 70% of the Global 500. Cohesity is also backed by industry leaders such as NVIDIA, Amazon, Google, IBM, Cisco, and HPE. Cohesity is certified as a Great Place to Work in multiple countries.
